Abstracts

Cardiac radiofrequency ablation is the delivery of an electrode catheter into a specific part of the cardiac cavity through a vein or an artery, and the release of radiofrequency current leads to coagulation necrosis of the local endocardium and subendocardial myocardium, thereby blocking the abnormal conduction beam and origin of tachyarrhythmia. interventional techniques. The damage range of the radiofrequency current introduced into the cardiac cavity through the catheter is 1-3 mm, which will not cause harm to the body. Radiofrequency ablation has become the most effective method for radical treatment of paroxysmal tachycardia. Cardiac RF Ablation Generators are one of the core devices for cardiac radiofrequency ablation.
