## Abstracts

Ultrasound machines are very valuable tool in healthcare diagnostic but they need transducer to capture the image. Ultrasound transducers works in a similar way as sonar or radar. Ultrasound transducers produce sound waves that bounce of body tissue and organs and make echoes. Ultrasound transducers have three elements: transmitter, receiver and trans-receiver. Transducer receives echoes and send them to computer which create picture of echoes called as sonogram. These transducers have one or more quartz crystals know as piezoelectric crystals. When electric current pass through these crystals they change shape. Due to change in shape sound waves are produced. Cardiac ultrasound transducers comes into different size and shapes.
