Abstracts

A state of marked loss of voluntary mobility in which the limbs remain in whatever posture they are placed is known as catalepsy. Voluntary motion loss, muscle rigidity, fixed posture, and diminished pain sensitivity are all symptoms of catalepsy. It can be a sign of a variety of diseases, including epilepsy, Parkinson's disease, substance abuse, catatonia, schizophrenia, and as a side effect of certain types of schizophrenia treatment. The treatment for catalepsy is determined by the underlying cause of the symptom. Antipsychotic medicines and muscle relaxants are two treatments that may be used to help with catalepsy.
