Abstracts

The discovery of a high-performance catalyst for hydrogen production could speed up this technology's path to the marketplace. Future energy needs could be based on hydrogen as the energy carrier. Potential applications range from vehicles including cars, boats and trains to homes and industrial processes. The process relies on expensive noble metal components such as platinum and iridium, the preferred catalysts for producing hydrogen through electrolysis at scale. These elements are expensive and rare, which has stalled the move to replace gas for hydrogen-based power.
