Abstracts

Cathode Powder are the main component of batteries Cathode; it determines the energy density of a cell through cell voltage and/or capacity. Lithium ion batteries are typically based on intercalation/deintercalation compounds, where lithium ions provided by the cathode are inserted into the host lattice (anode) during charge and extracted during discharge, with a minimal structural change in the host material. The choice of cathode material with a particular chemistry depends on various factors, including cell voltage, capacity, energy and power capabilities, cycle life, and temperature of operation.
