Abstracts

Cellulose Based Membranes are generally made from either cellulose, polyamide, or thin film composites. Cellulose Based membranes are prone to biological hydrolysis, which is avoided by adding 1 mg/L chlorine to the feed water. Chemical hydrolysis is avoided by operating at around pH 5. Cellulose membranes may be subject to compaction, so we must avoid excessive feed water temperature and pressure. Cellulose di/tri acetates are less affected by these problems although polyamides are still more tolerant of feed water temperature and pressure variations.
