Waterproofing can be explained as the process of making a structure or object waterproof or water-resistant so as to make it unaffected by water under specified conditions such as high moisture areas, internal seepages, rains etc. Only effective waterproofing can resist the inflow of water. The waterproofing materials have got to be used in wet environment as well as under water and hence need to be of specific composition and good quality. Cementitious waterproofing are being utilized in building structures (such as decks or wet spots), watercraft, canvas, electronic devices and paper packaging. Cementitious waterproofing provides a high bond strength to both steel and cement. Cementitious waterproofing guarantees concrete in sulphate contaminated ground conditions. It is useful for inside and outside waterproofing of concrete and other mineral substrates. Cementitious waterproofing is profitable for underground structures and furthermore on housetops and decks. The cementitious covering can shield interstates and beachfront structures from chloride and enhance the quality of the sustained bond.
