Abstracts

Ceramic capacitors are also electrostatic and are also used in power electronics and account for 30 percent of the global industrial capacitor market. The industrial-grade ceramic capacitor market includes single-layer disc ceramic capacitors; high voltage "doorknob" capacitors; multilayered axial and multilayered radial capacitors (legacy designs); and, making up the bulk of the market, high voltage ceramic chip capacitors to 5 kV for PCB applications.

Ceramics have lower production costs compared to film capacitors, and have made significant inroads into the line voltage segment of the market because they have lower pricing and robust performance. Ceramic capacitors also offer high-voltage, low-capacitance designs in the same manner as film capacitors. Ceramics cost less to produce because their feedstock materials (barium carbonate and titanium dioxide) are available in abundance, and these materials have extremely low and stable pricing.
