Abstracts

Cetane number is a measure of quality of ignition for diesel fuel. It indicates the time delay between injection and actual ignition of the fuel. Higher the cetane number, lower is the ignition delay, better is the ignition quality, more complete is the fuel combustion and better is the overall performance. In case of lower cetane number, higher is the overall time delay. Diesel fraction obtained from sour crude, blending of diesel with biodiesel or ethanol result in lower cetane number. Cetane number improver or simply cetane improver is that additive which is used to increase cetane number of diesel fuel. These Cetane number improver compounds are used in the concentration ranging from 0.06% to 0.4% and result in effecting increase in the cetane number by nearly 3 to 8. Thus, use of cetane number improvers result in improvement in overall ignition characteristics of diesel fuel. Moreover, cetane number improvers offer several advantages such as easy ignition of fuel, lowering smoke emission, wear reduction, smoother engine operation, among others. Cetane number Improvers are generally alkyl nitrate compounds which are decompose at higher temperatures and lower the initial boiling point of diesel fuel. Ethyl hexyl nitrate and Di-tertiary butyl peroxide (DTBP) are some of the commonly used as cetane number improver compounds.
