Abstracts

Chemosynthetic polypeptide drugs are composed of certain amino acids that combine to form a single unit. These drugs do produce a considerable remedial effect on different diseases, however, accompanied by a few side effects. Chemosynthetic polypeptide drugs are considered closely important mainly because of the therapeutic and curative effects it offers. Their prime areas of application are curing of diseases like tumor, metabolism, immunoregulation, cardiovascular diseases, and various other infectious diseases. These chemosynthetic polypeptide drugs are much more influential as compared to the traditional drugs, hence will likely replace the existing pharmaceutical drugs. Currently, there are more than 140 polypeptide drugs available in the global market. Some of the major chemosynthetic polypeptide drugs available in the global market are thymalfasin, thymopentin, somatostatin, octreotide and thyrocalcitonin.
