Acral erythema, also called as hand-foot syndrome or palmar-plantar erythrodysesthesia, is characterized by swelling, redness, paraesthesia (numbness) and desquamation (skin peeling) of palms, soles and rarely on knees and elbow. Acryl erythema is an adverse drug reaction which typically appear after several months of treatment with chemotherapeutic agents, gemcitabine and fluorouracil being the most common drugs causing reaction. Chemotherapy induced acryl erythema is a dose dependent condition, regression of which can be achieved by discontinuation of chemotherapy or by dose reduction. Treatment for chemotherapy induced acryl erythema includes symptomatic treatment with analgesics and antihistaminic drugs to reduce pain and edema.
