Abstracts

Toe walking is a common ailment found amongst toddlers and young adults. Toe Walking is a type of gait abnormality in which a child loses the right contact with the ground. If a child continues to walk in a flawed posture without any clinical interruption, then he or she might stumble into a severe neuromuscular problem. Physicians believe that an early detection and treatment of this ailment is always better for the affected person. There are several anti-toe walking cures available in the global market. From simple observations to critical operations all healing processes are distinctly used to cure this postural imbalance. Orthopedics mostly use tenotomies which are an age-old treatment used to cure this disease. Apart from this cure doctors often recommend anti-toe walker boots for these children who are affected by this problem. Studies revealed that children affected by developmental problems or autism become an easy prey of anti-toe walking. Children affected by cerebral palsy lose their healthy posture and starts toe-walking.
