Abstracts

Chronic thromboembolic pulmonary hypertension is observed to be one of the leading causes of severe pulmonary hypertension. It is a type of clinical condition in which pulmonary vascular resistance increases giving rise to pulmonary hypertension and progressive heart failure. According to World Health Organization (WHO), approximately 0.15% to 0.55% of the patients suffering with acute pulmonary embolism develop chronic thromboembolic pulmonary hypertension. Due to non-specific symptoms observed in chronic thromboembolic pulmonary hypertension its diagnosis is complex. However, some of the prominent symptoms of chronic thromboembolic pulmonary hypertension are chest discomfort, breathlessness and fatigue. Chronic thromboembolic pulmonary hypertension market can be segmented on the basis of types of diagnosis such as transthoracic echocardiogram (TTE), ventilation-perfusion (V/Q) scan, pulmonary angiography, heart catheterization, computed tomography (CT) pulmonary angiography and other pulmonary function tests.
