Abstracts

An orthopedic cast, or simply cast, is a shell, frequently made from plaster or fiberglass, encasing a limb (or, in some cases, large portions of the body) to stabilize and hold anatomical structures, most often a broken bone (or bones), in place until healing is confirmed. It is similar in function to a splint. A splint is a device used for support or immobilization of a limb or the spine. It can be used in multiple situations, including temporary immobilization of potentially broken bones or damaged joints and support for joints during activity.
