The ophthalmic viscoelastic agent is made by dissolving sodium hyaluronate and hydroxypropyl methylcellulose in phosphate buffer solution, then mixing, and then filtering, sterilizing, sub-packaging and sampling processing. The physical properties are determined by the length of its molecular chain and the interaction characteristics of the molecules within the chain. Most of the main components of ophthalmic viscoelastics are sodium hyaluronate, which is a cohesive viscoelastic agent and can be used as an auxiliary anesthetic.
