Abstracts

Colloidal silica is silica particles that are suspended in a liquid. The liquid is denser than water and has been stabilized electrostatically to allow the particles to stay suspended in the solution. The silica particles are also very small and do not have a large density. If the particles are too large, they will settle out of the solution. If the silica particles are too small, they are difficult to stabilize in a solution. Colloidal silica is not only available in bulk deliveries, but also in plastic drums and IBCs. In the report, QYR cover colloidal silica data by actual data instead of concentration conversion. The purity of most manufacturer products had more than 20%. Since the low-end market is very confusing, it may not be appropriate to convert by 30% solution or 100% active ingredient.
