## Abstracts

Color blindness results from the light-sensitive pigments in the cones of the retina receiving the wrong genetic coding for wavelengths of light. Complete color blindness is actually very rare. It is far more common for individuals to be able to see some colors, to a certain extent, but not as clearly as those without any form of color blindness. Color blindness testing may be a part of your eye exam at Deerwood Family Eyecare. The Igaku-Shoin Color Test for detecting colorblindness is used to detect red/green color deficiencies. Additional tests, designed to detect additional forms of colorblindness, may also be administered.
