Combination starters are the most common type of packaged motor controllers forming a critical input unit related to industrial drives and controls. Motor starter which can be 1 or 2 type coordination is made through combining a contactor with motor protective circuit breaker or circuit breaker. Coordination 1 or 2 safely control short-circuit by switching it off, offering a high degree of operational continuity to the system. Functions such as motor control, disconnect, overload protection, and branch circuit protection are majorly performed by combination starters. Furthermore, combination starter helps in safeguarding personnel from accidental starting of machinery and contact with live parts by disconnecting motor and starter. Combination starters provide more attractive and compact installation than separate units which can be prewired thereby eliminating the wiring cost between starter and separate disconnect. Combination starters find their application in pumps, conveyors, compressor, and other equipment; pumps are the key application which are attributed towards the growth of global combination starters market over the next decade. Combination starters possess features such as lifecycle of more than one million operations with an adjustable overload relay and current-limiting fuses. Moreover, North America is the most dominating region in the global combination starters market due to stringent installation, application, and product standards such as NFPA70, NFPA79, UL508A, UL489, and UL508 for governing electrical installations in the region.
