Abstracts

Catalytic combustion can be defined as a chemical process that involves use of catalysts in order to improve the efficiency of overall combustion process. The idea behind using catalyst during combustion is to lower the combustion point so that the fuel burns at a lower temperature and burn at a longer rate. The combustion catalyst have improved the fuel efficiency and has reduced the engine maintenance costs.

Combustion catalysts are used for a wide array of applications including marine, automotive and boilers amongst others. The use of combustion catalyst has also reduced the harmful carbon and other volatile organic compounds emission into the environment. Combustion catalyst also improves the mechanical efficiency of the engines by promoting cleaner combustion, reducing formation of unburnt hydrocarbon, reducing clogging of engines, and thus there has also been significant reduction in maintenance cost. The Combustion catalysts are also known as emission control catalysts.
