Abstracts

Computer goggles are functional glasses that have certain shielding and protection against computer radiation, screen glare, and harmful light that are harmful to vision health. Since the radiation of the computer comes from electromagnetic waves, etc., these waves have a certain wavelength and amplitude. The anti-radiation film is based on the undulation and interference of light. If the two waves are superimposed, they cancel each other out. The radiation protection film utilizes this principle, and the surface of the lens is coated with a plurality of anti-radiation films, so that electromagnetic waves of different wavelengths generated on the front and back surfaces of the film interfere with each other, thereby canceling the radiation.
