Abstracts

Concrete is strong in compression, but comparatively weak in tension. The inclusion of steel reinforcement improves the tensile strength of the element and, consequently, its resistance to stress. Unfortunately, in the presence of water and oxygen, steel corrodes. Therefore, in almost all likely exposure conditions for reinforced concrete, corrosion of the steel is a potential hazard.

This report studies Concrete Repair Mortars market. Concrete structures are prone to deterioration owing to several factors such as water infiltration, corrosion, structural damage or others. Concrete repair mortar material mends and protects the concrete structures by providing fortification against cracking, restricting corrosion, and chemical anchoring. With benefits such as enhanced bond strength, lowered shrinkage, impermeability, density, tensile strength, and thixotropy, concrete repair mortars are highly useful for several industries such as road and infrastructure, marine structures, utility, and building and construction.
