Abstracts

Congenital diseases are disorders in a newborn due to certain genetic factors (and sometimes in association with the environment) that often results in malformations or underdeveloped organs. Congenital Heart Diseases (CHD) results in malformed or undeveloped heart that presents in a newborn with breathing and circulation disorders. According to Lancet medical journal, CHD caused death of 0.22 million individuals and newborns globally in the year 2010. CHD was earlier erroneously associated with premature births, the association has no direct correlation with all forms of CHD and is mainly one of the many factors that can cause it. The genetic factors causing CHD consist of chromosomal errors in fertilization and the following meiotic division, these include: large chromosomal defects in trisomal chromosomes; small chromosomal defects like microdeletion of long/short arm of chromosome and random/environmentally induced mutation of heart muscle cell proteins, or associated proteins etc. The environmental factors like rubella infections, thalidomide drugs, metals (lithium, lead, mercury, etc), chronic illness in the mother (systemic lupus, diabetes, phenylketonuria, etc). Embryological changes, hormonal changes in the mother and certain birth deficiencies can also cause CHD and other birth defects in children. Besides these, according to some medical research reports, maternal obesity increased the chances of CHD in newborns; obesity was shown to increase the risk of previously hidden genetic traits of CHD in the new born children of such obese mothers.
