Abstracts

Congestive heart failure (CHF) is a physiological condition that has an adverse impact on the pumping efficiency of the cardiac muscles. It characterizes the accumulation of fluid around the heart leading to inefficient pumping. The onset of CHF is marked by the failure of the ventricles to pump sufficient volume of blood to the body organs. This eventually leads to deposition of fluid in the lungs, abdomen, liver, and lower body. CHF is treated by a number of devices that maintain heart rhythm, such as pacemakers, cardiac resynchronization therapy (CRT), implantable cardioverter defibrillators (ICDs), and ventricular assist devices (VADs).
