## Abstracts

The connector is a device which links two elements of an electronic system without improper signal distortion or power loss. In any electronic system connector are the primary point of failure due to poor designing, mechanical stress and environmental stress, this become a major issue in industrial areas, factories where heavy machineries and robotics are used. To overcome this limitation, contactless connectivity system is practiced, contactless connectivity system is a cross interconnection between contactless power and contactless data technology which easily link over a short distance deprived of physical contact. This way practicing contactless connectivity system provides resistance from vibration, rotational freedom, freedom of movement, unlimited mating cycles, and easy on-the-fly connection. In traditional connectivity approach, standard full-contact wired power and signal connectors are practiced, this has many advantages and disadvantages.
