Centrifugation is the process which involves the separation of heterogeneous mixture by means of spinning and this involves the application of centripetal force for the separation of liquids-liquid and liquid-solid mixtures. Centrifugation works on the principle of sedimentation that can be achieved by rapid rotation. Centrifuges are the devices which are used in separation of genetic materials, virulent substances, blood cell components, and others. The next generation centrifuges provides precise temperature control, wide range of relative centrifugal force (RCF), acceleration, and time. All the aforementioned parameters must be maintained and achieved for greater separation of quality components. Continuous flow centrifuges functions at relatively higher speeds as compared to the normal centrifugation devices. Such devices are very well known for their capability to isolate particles similar in nature. Whereas conventional centrifugation process separate molecules in batches, liquid flows continuously into continuous flow centrifuges. This saves time by eliminating several loading/unloading and accelerating/decelerating steps. Continuous flow centrifuges are also known for separating larger volumes than conventional methods. For these reasons, and because they are able to separate smaller particles such as viruses, bacteria, ribosomes, and proteins, these centrifuges are of particular interest to pharmaceutical and microbiology labs.
