## Abstracts

Photochemical reactions lie at the heart of photosynthesis and vitamin D formation, and play important roles in the manufacture of electronic equipment, protective coatings and the synthesis of drugs and fragrances. Continuous-flow operation has emerged as a new technology trend in synthetic organic photochemistry. Compared to traditional batch systems such as immersion well or chamber, flow photoreactors offer obvious advantages. These representative benefits make continuous flow an attractive option with the potential to implement preparative photochemistry for pharmaceutical applications and fine chemical productions.
