Abstracts

Continuous passive motion devices are used to ensure proper motion of limb, particularly, of the leg or arm. Continuous passive motion devices are used in the first stage of rehabilitation following the traumas and soft tissue medical procedure. These devices aims at continuous and repeated motion of joints in a structured range of motion. Continuous passive motion devices are in great demand owing to their wide range of applications in various medical fields involving children, bariatric patients and for reconstruction from joint surgery as in the anterior cruciate ligament ACL reconstruction and knee replacement. The increasing cases of traumas and joint replacement and the need to rehabilitate them all over the globe are facilitating the market for continuous passive motion devices. These devices improve long term functions, knee extensions in short or long term and also long term knee flexion. For the treatment of standard mobilization, continuous passive motion devices are useful. The daily treatment increases the mobility of affected joint. The continuous passive motion devices ensures safe exercise throughout the repair phase and healing of the distressed tissue and minimizes the postoperative pain with reduced chances of inflammation.
