Abstracts

Contraceptive gels are a form of chemical contraception which act as a birth control method. Contraceptive gels is over the counter (OTC) birth control method that can be used without doctor's prescription. Contraceptive gels can be used by itself or combine with other birth control method. Contraceptive gels are the chemical inserted into the vagina before sexual intercourse with an applicator. Contraceptive gels are effective for about one hour after the insertion. Contraceptive gels prevent the pregnancy in two ways, first by blocking the entrance of the cervix so that the sperm don't go to the egg and stopping sperms from moving to swim to egg. Contraceptive gels are no effective when used alone so it is used with other barrier control such as condoms, diaphragms and cervical caps which prevent from sexually transmitted disease. Contraceptive gels are easy to use and less expensive contraceptive gels comes in different consistencies and texture which contain one to five percent of chemical. Contraceptive gels have no long lasting effect on woman's hormones and effective in immediately killing sperms. Contraceptive gels provide lubrication along with immobilization the sperm. Contraceptive gels don not affect the menstrual cycle. Contraceptive gels chemicals are devised to kill the sperms before they reach uterus such as benzalkonium chloride, sodium cholate, Octoxynol-9, Nonoxynol-9. Sometime the gels used may cause irritation in vagina and cervix which may increase the rate of STD.
