Abstracts

Controlled atmosphere furnaces have a high percentage of nitrogen, argon, hydrogen, & helium (flushing) and almost no oxygen (inert), or a gas mixture or vacuum to achieve the desired product finish. The oxygen will need to be accurately measured, whilst the nitrogen is controlled and regulated to ensure the correct atmosphere is maintained and running costs are kept to a minimum. Controlled atmosphere furnaces are used in applications such as the manufacturing of metal products, where a specialised environment is required within the ovens and furnaces to achieve the desired product finish.
