Abstracts

COPD telehealth involves remote daily collection of vital signs and respiratory symptoms from patients using electronic means. A typical COPD telehealth kit consists of “peripheral devices” to collect the vital signs, such as blood oxygen saturation, connected to an electronic platform, for example a tablet computer or a smart phone. The information is collected and transmitted on daily basis to a team of telehealth practitioners via the internet. An alert-generating software is needed to computerize the process of flagging up patients with impending exacerbations e.g. by using a traffic light system. By examining the transmitted data, patients deemed at high risk will have their care escalated in line with agreed local protocols.
