Abstracts

Cranial implants are the implants used during cranial reconstruction procedures after cranial defects. Cranial defects are generally caused by injury, infection, or malignancy. Defects lesser than 3 cm in diameter do not need reconstruction and are generally repaired with bone cement. Defects greater than 3 cm are treated with cranial implants. These skull defects are reconstructed to protect the brain, restore the skull contour and normalize the cerebral hemodynamics. Generally custom-made implants are designed for the individual patient depending upon patient's condition. Cranial implants are made of biocompatible materials such as polymethyl methacrylate, porous polyethylene and titanium. The material of the cranial implants depends upon the surgeon's decision.
