Abstracts

Critical infrastructure comprised of all of the computer systems that could be targets of threats, industrial surveillance and politically motivated disruption. The power grid, railways, nuclear energy plants, water supply, etc. are the critical infrastructure that needs protection from cyber-attacks. Attacks on these networks can result in loss of life, threatening to public safety, attack on national security, or environmental disasters. So, in order to avoid these attacks, critical infrastructure protection (CIP) network security is implemented in industrial plants. SCADA systems are mainly used in industrial applications in order to control the network system to avoid threats or attacks. SCADA networks are mostly used in critical infrastructure to control the water treatment, oil pipelines, smart grid, and chemical manufacturing plants. The convergence of control networks with public and critical networks potentially exposes the control systems to additional security vulnerabilities. Use of wireless technology in critical systems expose vulnerable to attacks. Critical infrastructures strongly rely on systems and networks built over computing technologies and information systems.
