Abstracts

Cross bearing, also known as ten-byte, is mainly used in commercial vehicles. It is generally composed of a cross shaft and four stamped outer ring roller bearings. Each outer diameter of the cross shaft needs to be processed with high precision before it can be used as the inner part of the bearing. The needle roller is in contact with the needle roller. The needle roller bearing has a self-sealing device, which can prevent dust and grease from leaking, and improve the bearing life. When in use, the maintenance personnel regularly lubricate the four outer bearings through the hollow bearing of the cross shaft.
