Abstracts

Crossflow filtration uses a selective porous membrane that filters a liquid in order to purify, or clarify it. While in dead-end filtration the circulation of the liquid is not perpendicular to the filter (as in cartridges, plate filters, etc), in cross-flow filtration the circulation is parallel to the membrane.

In Crossflow filtration, wine passes tangentially across a membrane with a known permeability. This largely eliminates 'filter-caking' experienced with traditional 'dead-end' filtration methods and means Crossflow is a continuous rather than batch process.
