Abstracts

The cryogenic biobanking service industries operate cryogenic storage facilities. These facilities are used to store biological samples such as human blood, organs, tissues and cells that are used in pharmaceutical companies, hospitals, research laboratories and universities. Cryogenic biobanks preserve biological samples such as tissues, cells, saliva, urine, nucleic acid and organs in order to gain long term benefits of these samples. The duration for preservation of biological samples is either short-term or long-term. The main objective behind cryogenic biobanking is to maintain the functionality and stability of biological samples throughout their preservation period. In addition, advanced equipment like liquid nitrogen tanks, freezers, refrigerators, cryogenic vials, cryogenic boxes are commonly used in order to maintain sample stability during storage period.
