Abstracts

In today's world, the use of cryogenics and low-temperature refrigeration is taking a more and more significant role. From the food industry, transportation, energy, and medical applications to the Space Shuttle, cryogenic liquids must be stored, handled, and transferred from one point to another. To minimize heat leaks into storage tanks and transfer lines, high-performance materials are needed to provide high levels of thermal isolation. Complete knowledge of thermal insulation is a key part of enabling the development of efficient, low-maintenance cryogenic systems. The need for insulation is never a direct one. What is important is to save money on the energy bill or to be able to effectively control a system. Thermal insulation systems therefore provide energy conservation and allow system control for process systems.
