Abstracts

As the name suggests, cryogenic storage tanks are vacuum flasks used for storing cryogenics, such as liquid helium or liquid nitrogen, which have a boiling point lower than room temperature. These storage dewars (named after James Dewars) are available in several shapes, such as a flask with loose fittings, an open bucket or a special pressurizing tank. They are designed to keep heat away from the liquid contained in the inner vessel. With the help of vaporizers, the liquid is converted into a gaseous state, such as in the case of liquid nitrogen. A pressure control manifold controls the pressure at which the gas is fed to the process.
