Abstracts

Blended food colours are mixture of primary and/or secondary lake food colours. Primary and secondary colours are types of synthetic food colours. Primary food colours consists of basic colours and are also used as food additives. These type of synthetic colours are edible without any hazardous effects. Secondary colours are derived from primary colours, however, they cannot be used in excess. The availability of natural food colours are dependent on different natural resources, which are limited and also the quantity of natural colours obtained is very less. Hence, to cater the increasing demand of food colours, they are made synthetically by blending two or more colouring agents, which are water soluble. The blended food colours are available in different shades of colour and notes. The blend food colours are also made as per the requirements of a particular food processing industry and are called custom blend food colours.
