Abstracts

Mastocytosis is rare condition characterized by excessive accumulation of mast cells in the body tissues. Mast cells release large amounts of histamine in blood which leads to itchy skin, skin rash and hot flushes. These cells are found in skin and the lining of stomach and lungs. Mast cells accumulated in the skin is referred to as cutaneous mastocytosis. Usually affecting children, the most common symptoms of cutaneous mastocytosis is abnormal growth on the skin such as spots or blisters which can form a rash on the body. The World Health Organization (WHO) has classified cutaneous mastocytosis into three variants namely urticaria pigmentosa, diffuse cutaneous mastocytosis and solitary cutaneous mastocytosis. Besides these, there are two other forms of cutaneous mastocytosis namely nodular mastocytosis and telangiectasia macularis eruptive perstans (TMEP) which are currently under review as they are very rare form of condition.
