Abstracts

The heat dissipation of the semiconductor laser is directly related to the performance of the semiconductor laser. At present, the most important heat dissipation method for semiconductor lasers is to dissipate heat through a heat sink. Using diamond as a heat sink material is one of the important applications in the field of semiconductor lasers. In high-power semiconductor lasers, the commonly used heat sink materials for packaging include AlN and Cu. Among them, AlN is difficult to achieve good heat dissipation due to its low thermal conductivity, and the conductor characteristics of Cu will lead to electrochemical corrosion in the water-cooled heat sink channel, causing blockage. CVD diamond is an excellent heat sink material, and its thermal conductivity can reach up to 2000W (K-m), which is far greater than that of AlN and Cu.
