Abstracts

Cyclic olefin polymers are attractive high temperature polymers with outstanding optical properties, good chemical and heat resistance, and excellent dimensional stability. The three most important cyclo olefin monomers are norbornene, cyclopentadiene (CPD), and dicyclopentadiene (DCPD). The later two make up the largest portion in the C5 stream from steam cracked naphtha and account for about 15 to 25% of the total C5 fraction. Norbornene is only a minor component of the C5 stream and is usually produced by the Diels-Alder reaction of cyclopentadiene and ethylene. A commercially important derivative of norbornene is 5-ethylidene-2-norbornene (ENB) which is also made by Diels-Alder reaction with butadiene as the coreactant.
