Abstracts

Cystic Fibrosis, also known as mucoviscoidosis, is an inherited genetic disorder that affects the secretory glands, including mucus and sweat glands. It mainly affects the lungs and digestive system. An individual suffering from cystic fibrosis show characteristic symptoms, such as, secretion of thick and sticky mucus. The disease develops over a period of time in the lungs and blocks the tubes that carry air in and out. Increased secretion of thick mucus accelerates the growth of bacteria and hence, gives rise to serious lung infections. Some of the major symptoms of cystic fibrosis include persistent cough, constant lung infection, salty tasting skin, problem in breathing, bulky stools, difficulty in bowel movements, poor growth and poor weight gain. Some of the tests available for cystic fibrosis are newborn screening, sweat test, chest x-ray, lung function tests, and genetic testing. Cystic fibrosis can be divided into three segments, namely, cystic fibrosis mutations, curable type of cystic fibrosis, and rare type of cystic fibrosis. Some of the treatment methods for cystic fibrosis are chest physical therapy (CPT), exercise, consumption of antibiotics, lung transplant and postural drainage.
