Abstracts

Ophthalmology is the branch of medical science that deals with the management and study of anatomy, physiology, and diseases related to the human eye. Globally, the incidence of eye disorders and vision loss are becoming major public health issues. Some of the major eye diseases include age-related macular degeneration, glaucoma, cataract, bulging eyes, diabetic macular edema, ocular hypertension, retinal detachment, uveitis, and refractive errors. Cytomegalovirus retinitis refers to an eye disease caused by inflammation of the retina of eye. Cytomegalovirus is the causative agent of this disease. It is a herpes virus that attacks the photosensitive cells of retina. This disease spreads from one eye to another. Some common symptoms involved with cytomegalovirus retinitis are blurred vision, photophobia, blind spots and seeing floaters. If left untreated, cytomegalovirus retinitis leads to blindness. Cytomegalovirus generally stays in humans, however it stays dormant. It generally affects people with weak immune system such as HIV-positive patients. Medication for cytomegalovirus retinitis is available in various forms such as capsules, solutions, implants and tablets. The global market for cytomegalovirus retinitis treatment is increasing at a significant rate due to increase in the incidence of cytomegalovirus retinitis cases and growing awareness for different types of eye diseases.
