Abstracts

Datacenter transformation means looking at new approaches to improve the data center functionalities and performance. This transformation can be done by providing standardization, simplification, innovation, and integration of data centers without compromising security or data loss. The implementation services are used to optimize, integrate and automate the existing data centers. These services are provided with a broad range of tools to create a united and efficient migration of data centers. These systems are needed to transform an existing IT infrastructure into a pool of resources which are shared and virtualized and can be controlled centrally. As traditional data centers were not efficient, had a lack of resources, increased complexity, scalability and no standardized platform existed. Therefore, the IT and other industries strongly witnessed the need of data center transformation.
