Abstracts

Decubitus ulcer or pressure ulcer is an open wound on the skin. Decubitus ulcer occurs due to the breakdown of skin and underlying tissues through excessive pressure on an area of the skin. Some of the symptoms of decubitus ulcer are redness of the skin that worsens with time, and blisters on the area and then an open sore. Decubitus ulcers commonly occur on the elbows, back of the head, buttocks, heels, shoulders, hips, ankles, and back. Increasing incidences of decubitus ulcers and technological advancements in decubitus ulcer treatment products are some of the major factors driving the decubitus ulcer treatment market. Diagnosis of decubitus ulcer is based on clinical evaluation and nutritional assessment. Treatments for decubitus ulcer include pressure reduction, direct ulcer care, management of pain and control of infection, assessment of nutritional needs, and adjunctive therapy or surgery. Some of the required preventions include identification of high-risk patients, repositioning, conscientious skincare and hygiene, and avoidance of immobilization. On the basis of product, the decubitus ulcer treatment products market can be segmented into air fluidized beds, foam mattresses, alternative air pressure mattresses, low air loss beds, local area support products, and other full support products.
