Abstracts

Delayed coking is a thermal cracking process used in petroleum refineries to upgrade and convert petroleum residuum (bottoms from vacuum distillation of crude oil) into liquid and gas product streams leaving behind a solid concentrated carbon material—petroleum coke. These valves are the safety isolation devices that allow personnel to safely unhead a cooled drum while another drum is 'live'. If the valves do not positively isolate the coker drum, product could leak into an off-line drum causing a safety hazard to the personnel.
