Abstracts

The scientific term dental caries is known for the tooth decay or cavities. Tooth decays are generally caused by the specific endogenous bacteria such as *Streptococcus mutans* and *Streptococcus sobrinus*. It occurs by the production of acid that later destroys the layer and enamel of the tooth. The bacteria continues to grow to produce acid that gets into the inner layer of the tooth if the decay is not removed on time. In the U.S, approximately 90% of young adults have dental caries, while out of all dentate adults approximately 94% suffer from coronal caries. According to the estimation of WHO, on a global basis, 200,335,280 teeth were either decayed, filled or missing among just that age group.
