Abstracts

The emotional connection of natural teeth and the high nature of natural teeth have drawn attention to the development of bioengineered teeth (tooth regeneration). Tooth regeneration is a stem cell-based regenerative medicine procedure that, in the fields of tissue engineering and stem cell biology, replaces damaged or lost teeth by redrawing from autologous stem cells. As a source of new bioengineered teeth, somatic stem cells are collected and reprogrammed into induced pluripotent stem cells that can be placed directly in the dental plate or in a reabsorbable biopolymer in the shape of a new tooth.
