Abstracts

Acute cutaneous necrosis can be defined as a skin disease with sudden onset of tissue death that results in significant morbidity and is usually, but not always, excruciatingly painful. Early diagnosis can allow for early therapy and can decrease the chances of morbidity and loss of life. A thorough history is mandatory including recent reavel, drugs, underlying illnesses and recent surgical procedures. Blood tests that are often helpful are creatinine phosphokinase, blood cultures, antinuclear antibodies, rheumatoid factor, antinuclear cytoplasmic antibodies, hypercoagulability screen, creatinine, complete blood count and human immunodeficiency virus test. Other procedures such as computerized axial tomography and magnetic resonance imaging also helps to determine the extent of disease.
