The sanitary valve is a type of valve that fulfills specific health and safety standards for applications in the food and beverage industry. These sterile valves are essential to maintain the purity of the consumable food products that flow through them. Typically, the body is built with stainless steel, especially SUS304, and 316L, that meets high health standards. Brass and plastic are also acceptable, but stainless steel is preferred the most. Sanitary valves must not have any cavities and crevices to avoid bacterial growth. All components that are likely to contact the fluid, gas, or slurry are mirror polished. Moreover, the degree of polishing and cleanliness should also satisfy the health standards defined by its industrial function.
